

HOW TO CARE FOR YOUR

Pothos Cebu Blue

Care Guide

Epipremnum pinnatum 'Cebu Blue'

DID YOU KNOW?

Pothos Cebu Blue is native to the *island of Cebu in the Philippines*, where it climbs trees in tropical forests. Its silvery-blue, elongated leaves develop fenestrations (splits) as the plant matures and climbs — a stunning transformation.

BEFORE YOU START · POTTING TIP

Every Moontime Pothos Cebu Blue is **nursery-grown & pest-free**. Use a well-draining, airy mix with potting soil, perlite, and orchid bark. A pot with drainage is essential.

Propagate by **stem cutting with at least one node** in water or moist soil. Roots appear in 1-2 weeks. One of the easiest plants to propagate and share!

LIGHT	WATER	HUMIDITY	TEMP	PET SAFE	DIFFICULTY
Bright Indirect	Top 1-2in Dry	50%+	65–85°F	Toxic	Easy

Light

BRIGHT, INDIRECT LIGHT WILL KEEP THE SILVERY-BLUE COLOR MOST VIBRANT. TOLERATES MEDIUM LIGHT BUT GROWS MORE SLOWLY.

Direct sun scorches leaves. Low light dulls the silvery-blue sheen and slows growth significantly.

- Bright indirect is best
- No direct sun on leaves
- Tolerates medium light
- Slower growth in low light
- More light = better color

Water

ALLOW THE TOP 1-2 INCHES TO DRY BETWEEN WATERINGS. THOROUGH WATERING WITH FULL DRAINAGE. RELATIVELY FORGIVING OF MINOR UNDERWATERING.

Forgiving of occasional missed waterings. Water thoroughly and drain fully.

- Top 1-2 inches dry first
- Water deeply then drain
- Never sit in standing water
- Drain fully after watering
- Consistent moisture is ideal

Humidity

MODERATE TO HIGH (50%+). ENJOYS HUMIDITY BUT ADAPTS TO AVERAGE HOUSEHOLD CONDITIONS. HIGHER HUMIDITY ENCOURAGES LARGER LEAVES.

Adapts well to average homes. Extra humidity encourages larger, more dramatic leaves.

- Aim for 50%+ humidity
- Extra moisture is a bonus
- Adapts to average homes
- Encourages larger leaves
- Higher is always a bonus

Temperature

PREFERS 65-85°F (18-29°C). PROTECT FROM COLD DRAFTS AND SUDDEN TEMPERATURE CHANGES.

Keep warm and stable. Avoid cold windows and drafty spots in winter months.

- No cold drafts
- Keep away from vents
- Warm year-round
- 65–85°F is the sweet spot

Soil

WELL-DRAINING, AIRY MIX — POTTING SOIL WITH PERLITE AND A LITTLE ORCHID BARK. SUPPORTS HEALTHY CLIMBING ROOTS.

Airy mix supports healthy climbing roots and prevents waterlogging.

- Potting soil base
- Add perlite for drainage
- Add a little orchid bark
- Airy and well-draining

Fertilizer

FEED MONTHLY IN SPRING AND SUMMER WITH A BALANCED LIQUID FERTILIZER AT HALF STRENGTH. NONE IN FALL AND WINTER.

Regular feeding supports lush, silvery-blue growth during the active season.

- Monthly in spring/summer
- Balanced liquid formula
- None in fall/winter
- Dilute to half strength

REPOTTING

One of the easiest plants to propagate! Take a stem cutting with at least one node and root in water or moist soil. Roots appear in as little as 1-2 weeks.

COMMON PROBLEMS & SOLUTIONS

	CAUSE	SOLUTION
Yellow Leaves	Overwatering is the most common cause.	Allow more drying time between waterings.
Leggy Growth	Not enough light causing widely spaced leaves.	Move to a brighter indirect spot.
Brown Tips	Low humidity causing dry, crispy leaf edges.	Boost moisture in the air.
Root Rot	Consistently wet soil without proper drainage.	Improve drainage; reduce watering frequency.
Loss of Color	Insufficient light dulling the silvery-blue sheen.	Move to a brighter indirect location.

MOONTIME TIP

Pothos Cebu Blue is a collector favorite with its stunning silvery-blue leaves that develop fenestrations as the plant matures. Give it something to climb and watch the magic happen!

PET SAFETY

Pothos Cebu Blue is toxic to pets and humans. Contains calcium oxalate crystals. Keep away from cats, dogs, and children.
